

Protective & Marine Coatings

MACROPOXY™ C400V3 EPOXY ZINC PHOSPHATE

FORMERLY KNOWN AS EPIGRIP C400V3

Revised 01/2016 Issue 9

PRODUCT INFORMATION

PRODUCT DESCRIPTION

A multi-functional Epoxy Zinc Phosphate coating for the protection of carbon steel

RECOMMENDED USE

Macropoxy C400V3 Multi-functional Epoxy Coating is suitable for the protection of steelwork in a range of exposure environments from C1 to C5 as defined in ISO12944, including buildings, car parks, petrochemical plants, breweries and power stations. Not for immersion service. Often specified for use as a primer for structural steel on blast cleaned steel for internal and external environments, it may also be used as a high build intermediate coat as well as the final coat where a low sheen industrial and functional finish is required.

All Epoxy products will lose gloss and colour when exposed in an external environment and so where good colour and gloss retention is required in an external environment, or a full decorative finish is required in an internal environment, one of our topcoats designed specifically for this role should be chosen. A selection of available topcoats is listed in this data sheet under Recommended Topcoats.

Macropoxy C400V3 may be applied between 75 and 275 microns DFT in one coat depending on specification requirement. As many projects will differ in terms of client requirements and exposure environments, detailed project specifications are available from Sherwin-Williams separately.

ENDORSEMENTS

BS476 Part 7 - Surface Spread of Flame
BS6853 Appendix D - Smoke Emissions - For details of substrate/scheme, consult Sherwin Williams.

RECOMMENDED APPLICATION METHODS

Airless Spray
Conventional Spray
Brush
Roller

Recommended Thinner: No 2 (for thinning)
No 9 or No 13 (for cleaning)

PRODUCT CHARACTERISTICS

Flash Point: Base : 24°C Additive : 26°C

% Solids by Volume: 70 ± 3% (ASTM-D2697-91)

Pot Life: 2½ hours at 15°C 1½ hours at 23°C 1 hour at 35°C

Colour Availability: Limited range including MIO shades

VOC

257 gms/litre determined practically in accordance with UK Regulations PG6/23
289 gms/litre calculated from formulation to satisfy EC Solvent Emissions Directive
190 gms/kilo content by weight from formulation, to satisfy EC Solvent Emissions Directive

RECOMMENDED THICKNESS

Dry film thickness	Wet film thickness	Theoretical coverage
75 microns	107 microns	9.33m ² /ltr*

The minimum specification for MIO shades is 100µm nominal dry film thickness.

* This figure makes no allowance for surface profile, uneven application, overspray or losses in containers and equipment. Film thickness will vary depending on actual use and specification

PRACTICAL APPLICATION RATES - MICRONS PER COAT

	Airless Spray	Conventional Spray	Brush	Roller
Dry	75*	75	65	60
Wet	107	107	92	85

* Maximum sag tolerance typically 571µ wet (400µm dry) by airless spray and 179µm wet (125µm dry) by brush.

AVERAGE DRYING TIMES

	@ 15°C	@ 23°C	@ 35°C
To touch:	1½ hours	1 hour	¾ hour
To recoat:	5 hours	3½ hours	2 hours
To handle:	15 hours	7 hours	4 hours

These figures are given as a guide only. Factors such as air movement and humidity must also be considered.

RECOMMENDED TOPCOATS

Indefinitely overcoatable with epoxy systems provided the surfaces to be coated have been suitably cleaned. Where a high degree of gloss and colour retention is required overcoat with Acrolon C137V2, Acrolon C237, Acrolon 1850 and Acrolon 7300 within 7 days at a minimum dft of 50 microns or in the case of Acrolon C750V2 overcoat within 4 days. These overcoating times refer to achievement of optimum adhesion @ 23°C and will vary with temperature. For overcoating with alkyd systems consult Sherwin-Williams for advice.
Overcoatable with Sher-Cryl M770 Water Based Finish within 1 month @ 15°C

PACKAGE

A two component material supplied in separate containers to be mixed prior to use

Pack Size:	20 litre and 5 litre units when mixed
Mixing Ratio:	7 parts base to 1 part additive by volume
Weight:	1.57 kg/litre (may vary with shade).
Shelf Life:	2 years from date of manufacture or 'Use By' date where specified

Protective & Marine Coatings

MACROPOXY™ C400V3 EPOXY ZINC PHOSPHATE

FORMERLY KNOWN AS EPIGRIP C400V3

Revised 01/2016 Issue 9

PRODUCT INFORMATION

SURFACE PREPARATION

Blast clean to Sa2½ BS EN ISO 8501-1:2007. Average surface profile in the range 50-75 microns.

Ensure surfaces to be coated are clean, dry and free from all surface contamination.

Manually prepared surfaces should be prepared to a minimum standard of St3 BS EN ISO 8501-1:2007 at the time of coating. Application to such surfaces should be by brush or roller where the mechanical action will aid adhesion.

APPLICATION EQUIPMENT

Airless Spray	For dft applications between 75-125µ	For dft applications between 125-300µ
Nozzle Size:	0.33mm (13 thou)	0.38mm (15 thou)
Fan Angle:	40°	40°
Operating Pressure:	155kg/cm ² (2200 psi)	155kg/cm ² (2200 psi)

The airless spray details given above are intended as a guide only. Details such as fluid hose length and diameter, paint temperature and substrate shape and size all have an effect on the spray tip and operating pressure chosen. However, the operating pressure should be the lowest possible consistent with satisfactory atomisation. As conditions will vary from job to job, it is the applicators' responsibility to ensure that the equipment in use has been set up to give the best results. If in doubt Sherwin-Williams should be consulted. For MIO shades, use the 125-300µm recommendations.

Conventional Spray

Nozzle Size :	1.27mm (50 thou)
Atomising Pressure:	2.8kg/cm ² (40 psi)
Fluid Pressure :	0.4kg/cm ² (6 psi)

The details of atomising pressure, fluid pressure and nozzle size are given as a guide. It may be found that slight variations of pressure will provide optimum atomisation in some circumstances according to the set up in use. Atomising air pressure depends on the air cap in use and the fluid pressure depends on the length of line and direction of feed i.e. horizontal or vertical.

For application by conventional spray, it may be necessary to thin the paint by the addition of up to 10% Cleanser/Thinner No. 2. Where thinning has been carried out the wet film thickness must be adjusted accordingly.

Brush and Roller

The material is suitable for brush and roller application. Application of more than one coat may be necessary to give equivalent dry film thickness to a single spray applied coat.

APPLICATION CONDITIONS AND OVERCOATING

This material should preferably be applied at temperatures in excess of 10°C. Relative humidity should not exceed 90% and in these conditions good ventilation is essential. Substrate temperature shall be at least 3°C above the dew point and always above 0°C.

At application temperatures below 10°C, drying and curing times will be significantly extended, and spraying characteristics may be impaired.

Application at ambient air temperatures below 5°C is not recommended.

In order to achieve optimum water and chemical resistance, temperature needs to be maintained above 10°C during curing.

If it is desired to overcoat outside the times stated on the data sheet, please seek advice of Sherwin-Williams.

ADDITIONAL NOTES

Drying times, curing times and pot life should be considered as a guide only.

The curing reaction of epoxies commences immediately the two components are mixed, and since the reaction is dependent on temperature, the curing time and pot life will be approximately halved by a 10°C increase in temperature and doubled by a 10°C decrease in temperature.

Epoxy Coatings - Colour Stability:

Variable colour stability is a feature of epoxy materials which tend to yellow and darken with age whether used on internal or external areas. Therefore any areas touched-up and repaired with the same colour at a later date may be obvious due to this colour change.

When epoxy materials are exposed to ultra-violet light a surface chalking effect will develop. This phenomenon results in loss of gloss and a fine powder coating at the surface which may give rise to colour variation depending on the aspect of the steelwork. This effect in no way detracts from the performance of the system.

Epoxy Coatings - Tropical Use

Epoxy paints at the time of mixing should not exceed a temperature of 35°C. At this temperature the pot life will be approximately halved. Use of these products outside of the pot life may result in inferior adhesion properties even if the materials appear fit for application. Thinning the mixed product will not alleviate this problem.

The maximum air and substrate temperature for application is 50°C providing conditions allow satisfactory application and film formation. If the air and substrate temperatures exceed 50°C and epoxy coatings are applied under these conditions, paint film defects such as dry spray, bubbling and pinholing etc. can occur within the coating.

Numerical values quoted for physical data may vary slightly from batch to batch.

HEALTH AND SAFETY

Consult Product Health and Safety Data Sheet for information on safe storage, handling and application of this product.

WARRANTY

Any person or company using the product without first making further enquiries as to the suitability of the product for the intended purpose does so at their own risk, and Sherwin-Williams can accept no liability for the performance of the product, or for any loss or damage arising out of such use.

The information detailed in this Data Sheet is liable to modification from time to time in the light of experience and of normal product development, and before using, customers are advised to check with Sherwin-Williams, quoting the reference number, to ensure that they possess the latest issue.
