

RetractaPost™

Generated on 11.07.2020

Detailed description

A simple, cost efficient but highly effective and convenient way to prevent unwanted vehicle access and deter ram raids. A padlock is positioned at the base of the post, between the post and cover flap for added protection. A choice of padlocks is available to offer an increasing level of security. The post is operated by lifting fully out of the ground and then rotating 45°. The lug at the rear of the post aligns with the flap to allow the padlock to lock the post to the flap.

Features:

- No internal mechanism.
- Mild steel sliding post facilitates smooth moving action.
- Standard or higher security padlocks can be fitted.
- In the event of damage, the sliding post can be replaced by authorized key holders.
- Will only lock in the up position – no jamming possible below ground.
- Flap design helps protect padlock from malicious attack.
- All parts are fully galvanized and corrosion protected.
- Painting and powder coating coloured finishes available as extra.
- Supplied with self-adhesive safety reflector for higher visibility.
